

All-Dry Basement Systems® can be installed in a finished or unfinished basement, anytime of the year whether your basement is wet or dry.

The patented All-Dry Basement Systems® superior design controls basement water problems where the wall and the floor meet. The All-Dry Basement Systems® is effective on most types of walls, including poured concrete, block, brick and stone. Each interior drainage system is customized to every structure.

*We recommend the entire interior area be treated (where the wall and the floor meet) as well as a subfloor pressure relief system, in the middle section of the floor with a sump pump. Sometimes more than one pump may be needed. Other problem areas of water entry that may require additional treatment include windows, door entrances, tops of walls, wall cracks, floor cracks and untreated areas. If structure is partially treated, customer should not expect untreated areas to be All Dry.*

### Mold and Mildew:

Most commonly associated with moisture. Mold needs three conditions to grow - food, water and a suitable temperature. Waterproofing your basement will not always stop your mold and mildew problem. In these cases we recommend a de-humidifier for the moisture and an air purifier to control your indoor air quality.

We offer mold treatment with Bio-Clean, an All Natural product made of green tree oil.

### Basement Health!!!!

Recent EPA studies found that the average basement had approximately 1,000 gallons of moisture entering the home through concrete floors and walls. Also approximately 50% of the air you breathe in upper levels of your home comes from the basement or crawl space, this is called stack effect. All Dry

### Foundation Failure:

Moisture under your foundation will remain consistent until it is introduced to excess moisture from run-off water or plumbing leaks. As evaporation and transpiration take place, the soil can shrink the perimeter of your foundation, which can cause the foundation of the structure to move.

This uneven movement can cause foundation failure and cosmetic damage to the structure. We recommend a piercing system, which is extended to sub surface strata, which provides vertical support.

Structural and wall repairs are sometimes needed when cracks, bowing of walls or settlements are found in structures. Custom recommendations range from Carbon Fiber Strip Treatments, Wall Anchors, I-Beams or wall replacement in severe cases. The settling of outside soil increases pressure on exterior walls causing the walls to crack and move inward.

FOUNDATION PIERING SYSTEMS  
"ENGINEERING THAT MAKES SENSE"

## STABIL-LOC™ FOUNDATION PIERING SYSTEM

### Advantages

- ✓ PATENT PENDING LOAD BEARING DESIGN
- ✓ INSTALLED DIRECTLY UNDER THE LOAD
- ✓ INTERIOR OR EXTERIOR INSTALLATION
- ✓ UNIQUE INTERLOCKING, HIGH STRENGTH STEEL
- ✓ NO BRACKETS, NO BOLTS, NO BREAKING THE FOOTING
- ✓ NO OFFSET LOADS
- ✓ ENGINEER CERTIFIED 10+ SAFETY FACTOR
- ✓ DEEPEST DRIVEN PIER ON THE MARKET

### Flaws

- ✓ ELIMINATED

## THE PERMANENT SOLUTION FOR WET BASEMENTS

Patented System  
Lifetime Warranty  
Financing

offers a closed crawl space and sealed basement drainage for the walls and buried floor tile drain, including the sump pump. Reducing soil moisture and gases such as radon is why All Dry recommends this to home owners. We do recommend that you have your home tested for Radon and treated if necessary.
